

16 – 18 November 2024

Common Ground Bukit Bintang, Kuala Lumpur

Challenge 1

Predict the faults across a given 2D seismic dataset.

Team **DSGS101**

Chun Yan Lim	(Reservoir Engineer)
Zulfadhli Mohd Zaki	(Geoscientist)
Teo Sheng Pu	(Data Engineer)
Max Wei Xiang Ooi	(Data Scientist)
Izzudin Hussein	(Data Scientist)

Sponsored by:

01 – Meeting between Nigel and Rachael

Mr. Nigel, Geoscience Mgr
Data Rich Oil Company

Racheal, Ambitious
Geoscientist

2. Hi Mr Nigel. OMG! We have to stop them. Looking at some of the seismic images, Fault Block A and Fault Block B is clearly divided by a fault

But interpreting seismic for the whole field is so **time consuming**. It would take months, if not a year!

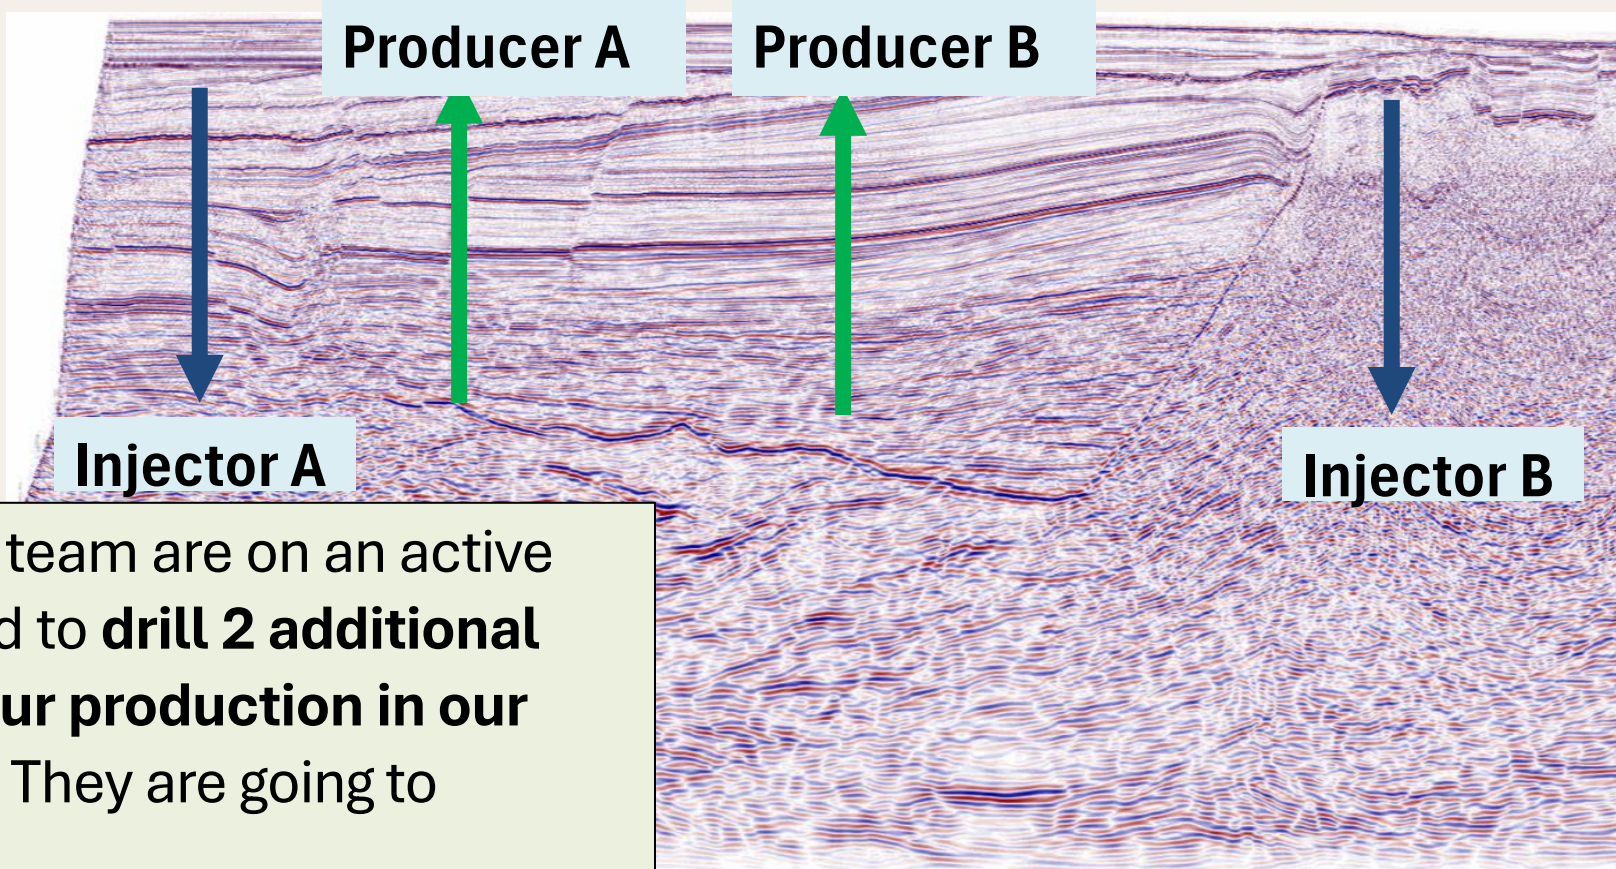

3. I have an IDEA. We can leverage our in-house DS team to built an AI tool

We have some interpreted seismic from our older field that we can use as dataset!

Seismic datasets

- 439 seismic images.
- 364 faults images, including 2 faults with missing seismic images.
- Only **362 seismic/faults** images used.
- Train/Test split: **66% Train/33% Test**

1. Hey Rachael, the reservoir team are on an active drilling campaign and planned to **drill 2 additional water injectors to support our production in our newly discovered field ZZZ**. They are going to contact the rig in 2 weeks!

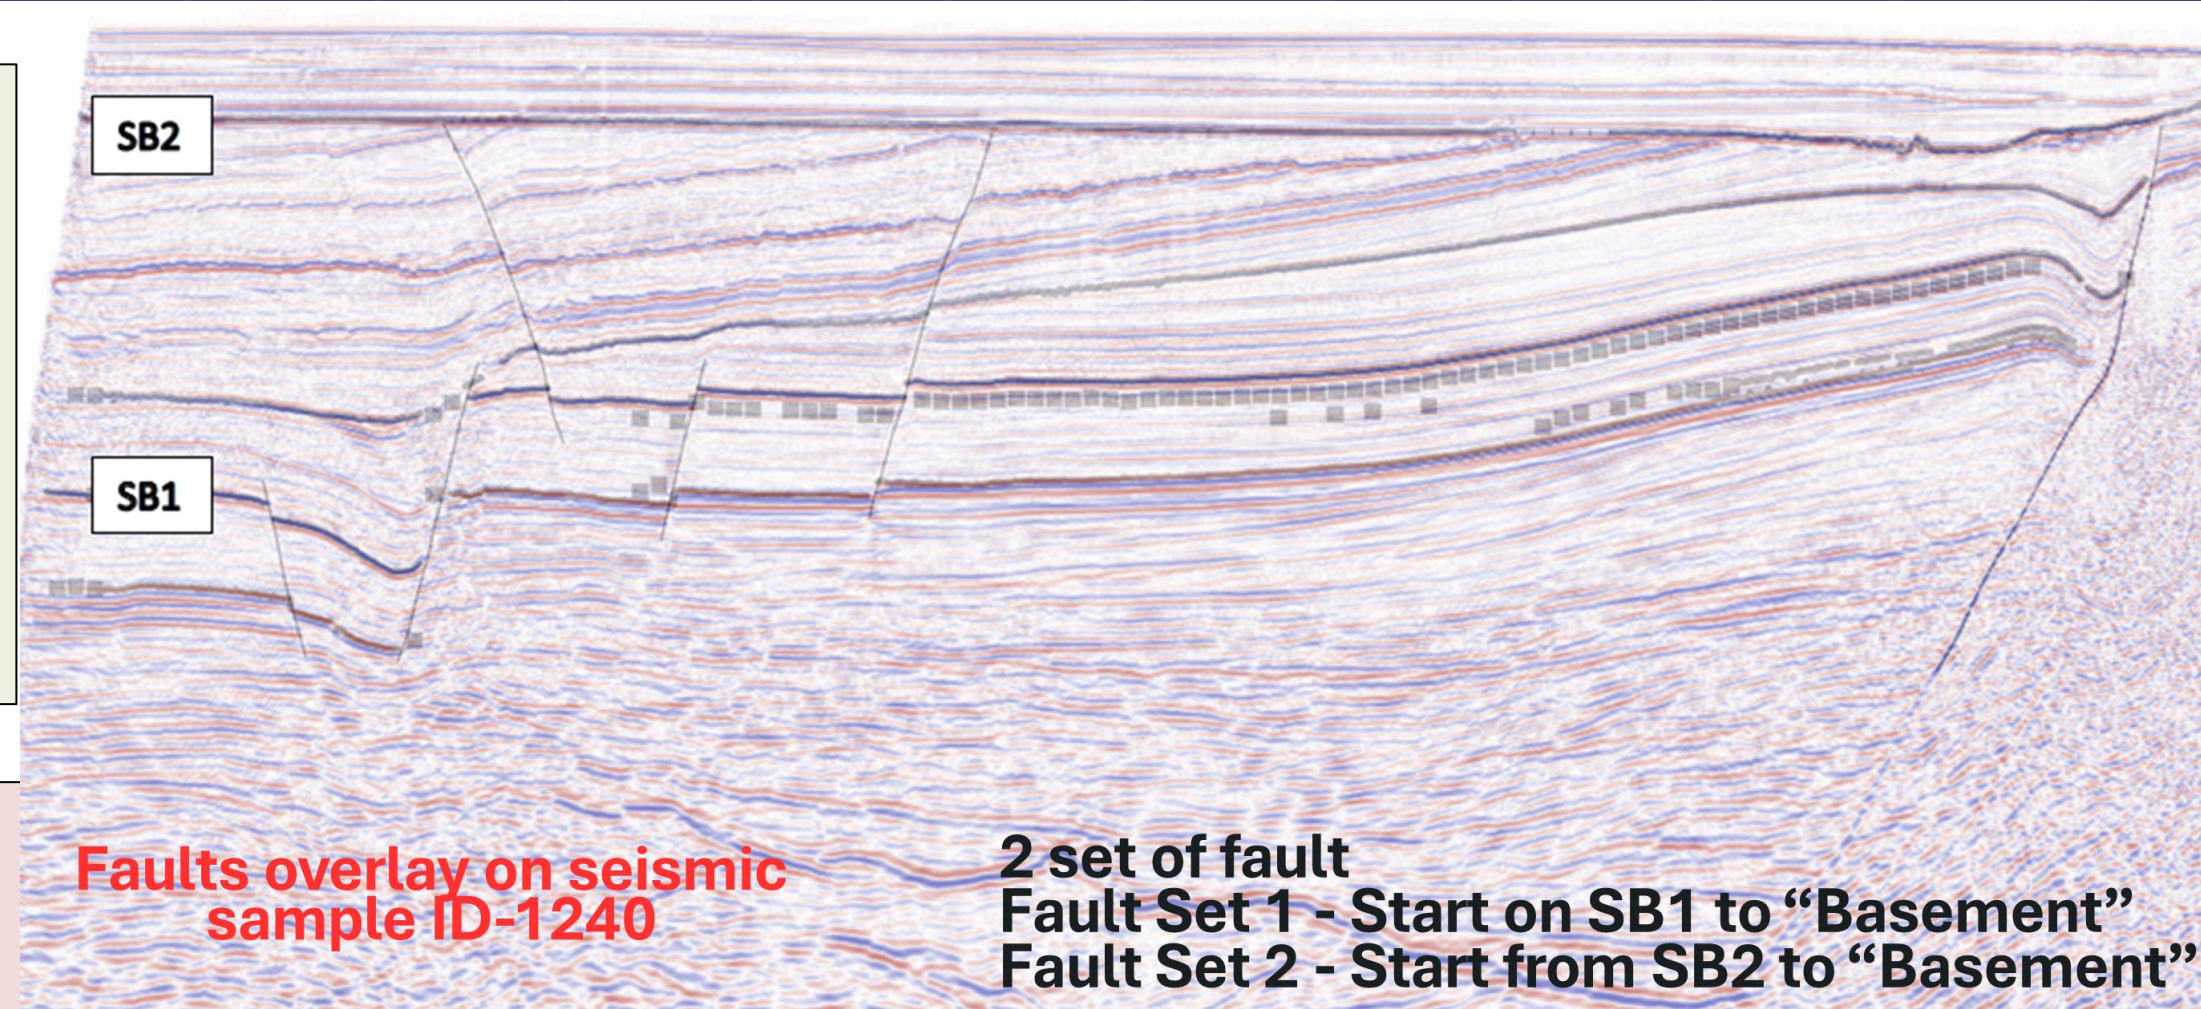

02 – The next day.....

Data Science Team

1. Hey Rachael, this is an impossible task! The **given dataset is so imbalance**. There is no incentive to force our model to accurately match the fault

Racheal, Very Ambitious Geoscientist

2. Hi Team!

I think we should pre-process our input data prior to training. Do you think we should **discretize** the dataset?

Also, we should use Focal Loss since the dataset is heavily imbalanced. Maybe hyperparameter tuning on the loss function will help ?

Image Discretization – To increase focus on imbalance dataset and increases the amount of dataset

03 – Methodology (Data Pre-Processing)

Data Science Team

1. That's a really good idea. We can increase

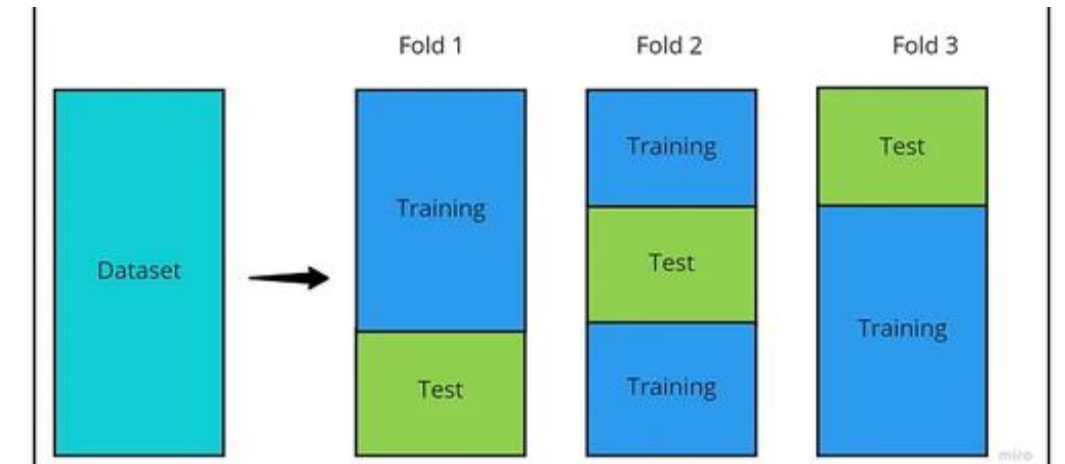

2. What do you think of the idea of increasing the width of the labels ?

It doesn't change the geology but will significantly help our model

Image Enhancement

Normalization & Contrast

Cross Validation

Key Differentiators:

1. Tailored Pre-processing steps for seismic image
2. Enhancing Seismic Reflector
3. Wider fault to help interpretability
4. Addressing imbalanced data

Fault "Thickening"

04 - Results

Our Model - CrackNet

Epochs: 50
Image Size: 512 x 512
Batch Size: 6
Learning Rate: 0.0001
Evaluation Matrix: Weighted F1 Score (Addressing imbalanced data)
Loss: Enhanced Focal Loss with alpha

That's really impressive.

All our pre-processing work paid off

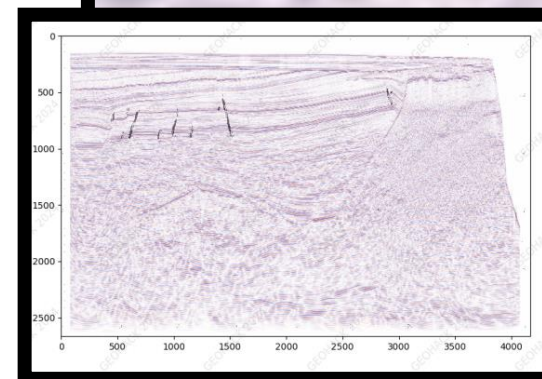

The CrackNet model is now able to capture the faults really well

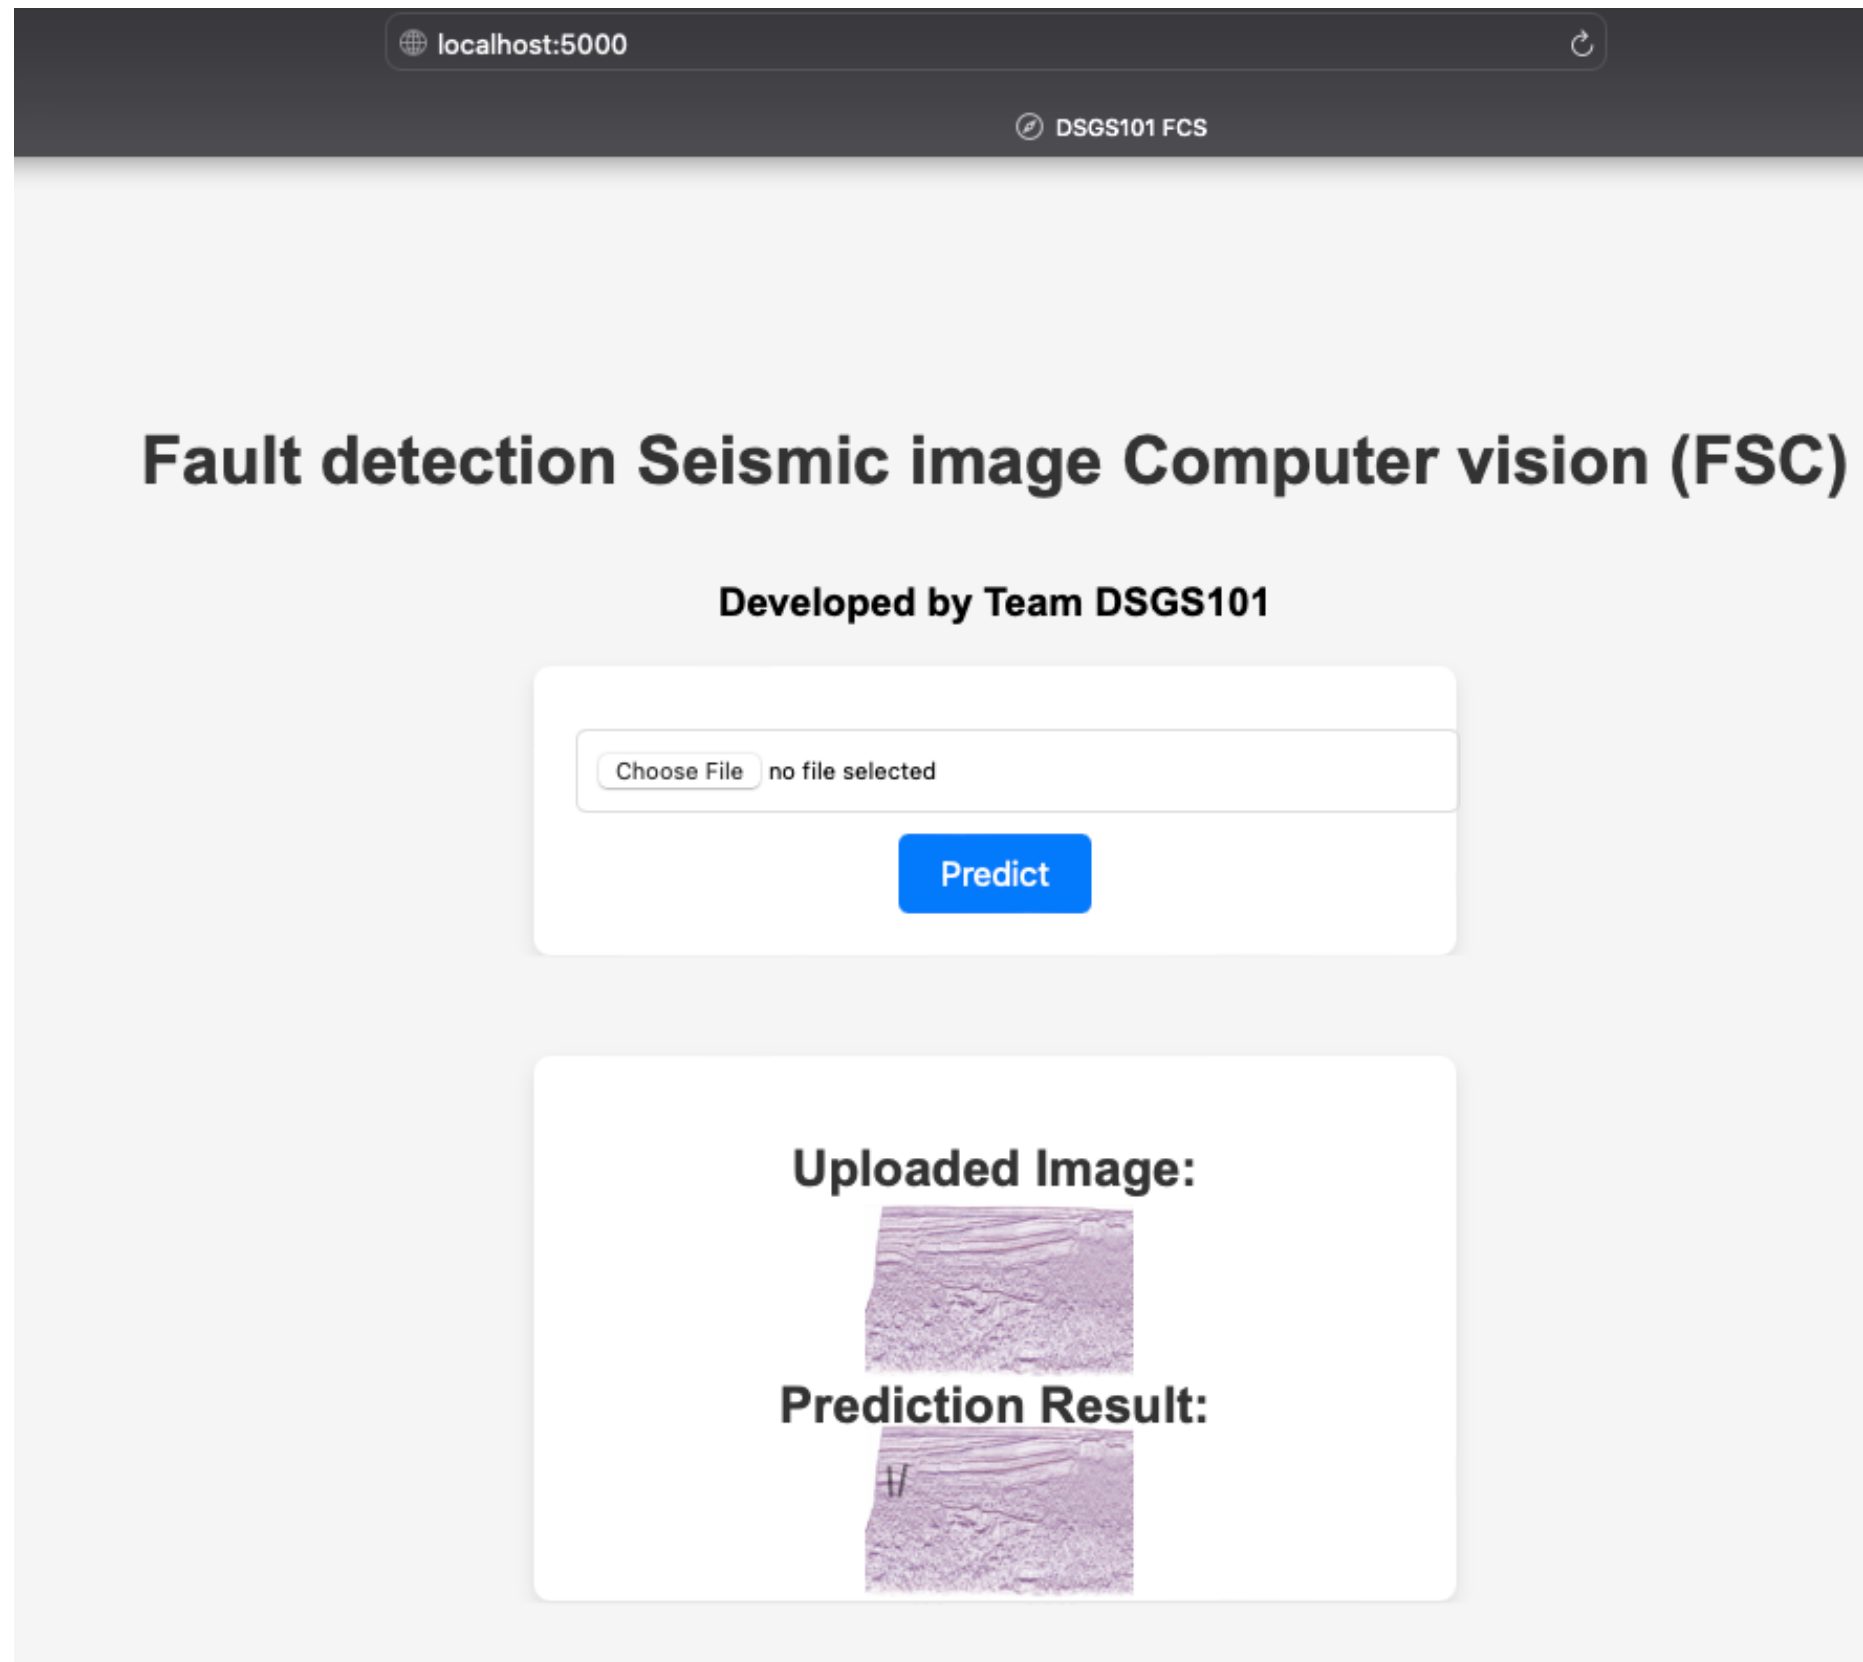

Our model CrackNet performance on the validation dataset with 3 folds cross validation

05 - Visualization of results

on holdout data

06 - How to interface with the model?

Web application developed with Python Flask framework.

The end user will upload their seismic image into the tool and the model will generate the fault that overlays on top of the seismic image.

1. Great job, team!

Now the reservoir team is able to use this to guide their drilling campaign

Thank you!

03 - Methodology

The HOW?

Data Science Team

Image Size Reduction

Reduces memory usage

Image Cropping

Data Pre-processing

Ensure important feature are fed into the model

Image Enhancement

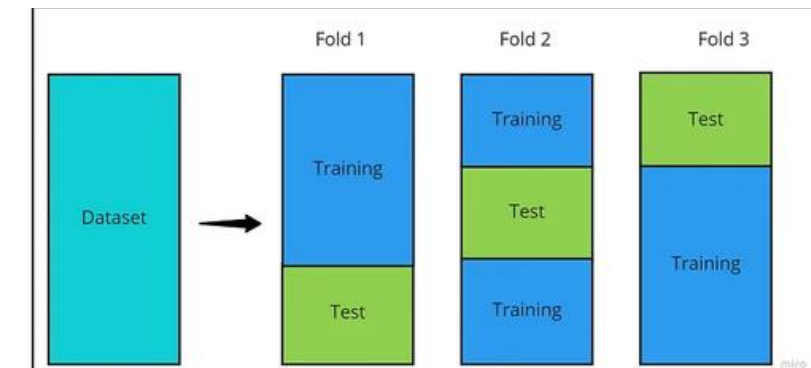

Normalization & Contrast

Ensure model compatibility

Improve training set label area

“Thickening” Fault

Cross Validation

increase the datasets size and focus on the contours

Our Differentiator

1. Tailored Pre-processing steps for seismic image
2. Enhancing Seismic Reflector
3. Wider fault to help interpretability
4. Addressing imbalanced data

Our Model - CrackNet

Epochs: 50
Image Size: 512 x 512
Batch Size: 6
Learning Rate: 0.0001
Evaluation Matrix: Weighted F1 Score (Addressing imbalanced data)
Loss: Enhanced Focal Loss with alpha
